20 were attached to 10 intervention PHCs. Median age was 31.5yrs (IQR 26.8-35.3, range 20-38); 31 (81.6%) were married. Highest education was primary-level for 12 (31.6%), secondary for 14 (36.8%), tertiary for 7 (18.4%), and none for 5 (13.2%). English-speaking proficiency was “none” for 1 (2.6%), “basic” for 21 (55.3%), “moderate or better” for 16 (42.1%). Median time-period since HIV diagnosis was 2.0 years (IQR 1.84-3.3). Mean pre-test and post-test scores were 72.4% and 87.7% respectively. The MM program’s early successes included better MM work attendance, improved documentation, increased timeliness/less missed opportunities for client tracking and increased frequency/quality of MM-client interactions.

**Going Forward**: Even though education and English proficiency were relatively low, MMs were able to absorb and retain training knowledge. Their relatively high baseline PMTCT knowledge was encouraging. With appropriate supervisory support, these lay HIV-positive women could make a difference.

**Para nuestra comunidad: A Spanish video promoting clinical trials, biospecimen studies and research participation for advancing cancer research and quality care**

M. Serrano, K. Ashing; City of Hope, Duarte, CA/US

**Background**: The recruitment of ethnic minorities, particularly Latinos, into clinical trials (CT) and biospecimen studies (BB) is a formidable challenge. Latinos equal 17% of the US population and cancer is their leading cause of death. Increasing their inclusion in biomedical research contributes to advancing public health and medical research and practice. Videos have been used widely in health education with Latinos; yet videos promoting Latino participation in CT and BB are scarce. Most materials and videos have focused solely on CT participation and are translated from their English counterpart but do not address BB. Therefore, we created a culturally and linguistically tailored 3-minute Spanish video to promote Latino participation in CT and BB studies. The specific aims are to: 1) educate on the importance of CT and BB studies; and 2) promote acceptability and willingness to participate in CT and BB studies.

**Methods**: The Theory of Reasoned Action/Planned Behavior was used to guide the video production. The literature, community assessments, and focus group data informed the development of the video. The video was finalized using a consensus process, and evaluated by City of Hope’s community partners and City of Hope clinicians who were fluent in Spanish and serve the Latino community. Preliminary evaluation was conducted with Latino advocates, survivors and/or family members (n=69). Participants viewed the video then completed a short evaluation measuring knowledge, acceptability and willingness to participate in CT and BB.

**Findings**: The mean levels of knowledge about the importance of research participation before and after viewing the video were 3.38 and 4.38, respectively. The difference was statistically significant (t=4.95, p<0.01). Preliminary evaluation shows that the video increased knowledge, acceptability and willingness to participate in CT and BB among Latinos. Therefore, this culturally and linguistically appropriate video has potential as an effective strategy for engaging Latinos in CT and BB. The limitations to our study findings include our relatively small sample size, which doesn’t allow us to determine differences in other demographics characteristics (e.g. age, income, etc). Also, the participants were primarily from the Los Angeles area, and thus are not necessarily representative of the larger national Latino community so the findings cannot be generalized.
